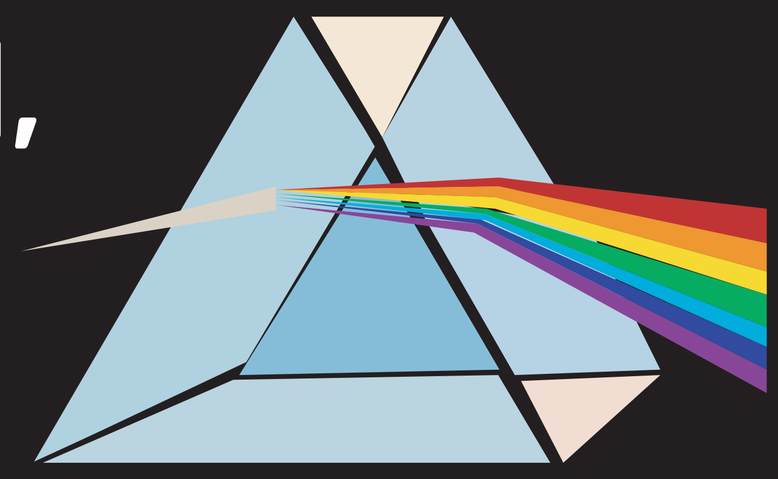
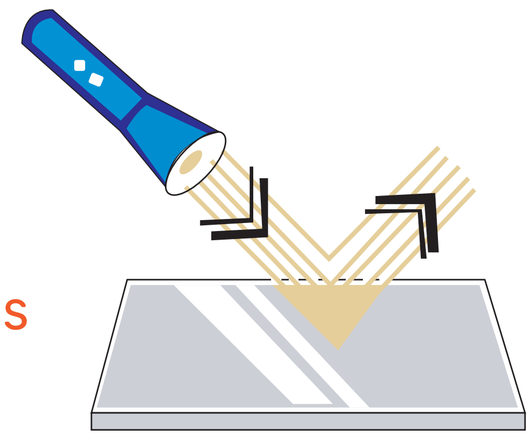
REFLECTION, REFRACTION & DISPERSION

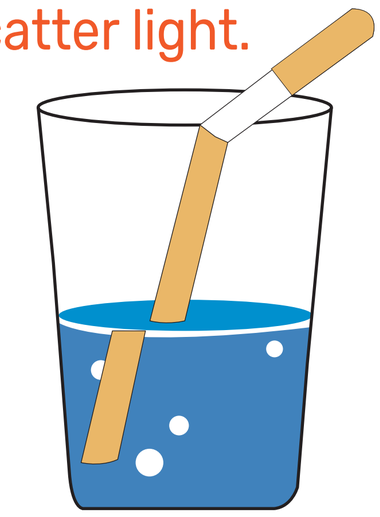
LIGHT: REFLECTION, REFRACTION, AND DISPERSION



REFLECTION

When light hits a surface and bounces off in a different direction, it is called reflection. It is how we see the objects around us. Shiny surfaces, like mirrors, reflect light in specific directions, while other surfaces, like paper, scatter light.





REFRACTION

Light refraction occurs when light rays, bend as they pass from one medium to another. This happens because light travels, at different speeds through different mediums. For example, light slows down when passing from air to water, because water is denser than air.

DISPERSION

White light is made up of all the colors of the visible spectrum. When white light passes through a prism, it slows down and bends in different directions separatng the white light into its component colors.
