INSTRUCTION TO CANDIDATES:

This paper consists of **one compulsory** *examination item. Responses to this item are to be written in the spaces provided in this booklet. Use* ***blue*** *or* ***black*** *ink.*

All working must be clearly shown.

Graph paper is provided.

Mathematical tables and silent non-programmable scientific calculators may be used.

You are not allowed to use reference books (i.e. text books, booklets on quantitative analysis etc.).

You are advised to carefully read the item, make sure you have all the apparatus and chemicals that you may need and then ***plan*** *appropriately before starting.*

Item

In industries such as food processing and chemical manufacturing, dissolving substances efficiently is very important. It is observed that increasing temperature often speeds up the dissolving of solid substances in liquids. Understanding how temperature affects the rate of dissolution is therefore essential in chemistry.

Senior one learners carried out an experiment on dissolving common salt in water to study how temperature affects the rate of dissolution. However, at low temperatures, the salt dissolved very slowly, making it difficult to obtain clear results within a short time.

To improve their investigation, their teacher referred them to you to design a better experiment that clearly demonstrates how temperature affects the rate at which salt dissolves in water.

In this experiment, different temperatures of water are used while keeping other factors constant, and the time taken for a fixed mass of salt to completely dissolve is recorded.

You are provided with:
- 10g of Common salt (sodium chloride)
- 600mls of Water
- Heat source
- Thermometer
- Beakers
- Measuring cylinder
- Stopwatch
- Stirring rod

Task
(a) Design and carry out an experiment that can be used to help the factory.
(*Your design should include the aim, hypothesis, variables, apparatus and materials, procedure, and risks and their mitigation.)*

For Scorer's Use Only

Basic Codes	A	H	V	P	R
Scores					

b) use the data below and carryout analysis and interpretation, write a conclusion and recommendation based on this result.

Results

Volume of water used =50.0cm^3

Mass of common salt used = 5g

Table of results

Tempt ºC.	27.0	30.0	40.0	50.0	60.0	70.0
Time(s)	123.0	90.0	77.0	55.0	41.0	25.0
