PAPER 1

THEORY

2 hours 30 minutes

INSTRUCTIONS TO CANDIDATES

This paper consists of two sections, A and B. it has six examination items

Section A has two compulsory items.

Section B has two parts; I and II. Answer one item from each part.

Answers must be written in the answer booklets, provided.

Answer Four items in all.

Any additional item(s) answered will not be scored.

For Examiner's Use Only							
Section	A		B				
Item Number	1	2	3	4	5	6	Total wtd Scored

SECTION A
SOIL SCIENCE AND VALUE ADDITION

Item 1

Mr. Opio, a farmer from Gulu district, deals in milk production. He rears only dairy animals on his farm. After milking, he pours milk in the jerrycans for easy transportation from his farm to the nearby market Centre for selling to individual people at different prices. One customer identified cow dung in the milk he bought; the following day he declined to buy from him which sparked an intense quarrel between Mr. Opio and his customer. Since that day Mr. Opio's milk sales have declined and the milk that remains is taken back home and in the late hours the milk goes bad, and he pours it away. His fellow dairy farmers who are part of a dairy cooperation in the same area are getting huge profits from milk sales. One day, Mr. Opio attempted to make yoghurt from the milk that remains, but it was too watery.

Mr. Opio thought of buying a fridge but does not have enough money and he is worried of his business.

Task

- a. Design the steps Mr. Opio should follow to make good yoghurt for his customers.
- b. Advise Mr. Opio on how he can improve on his business so as to get more profits.

Item 2

Peter purchased three acres of gently sloping land for growing maize. The same piece of land is being claimed by another person who has registered a case against him to the police. The upper part of his land had some gully like depression and right part of his land dries out very fast while the soils on the left part are hard and does not allow water penetration.

And the lower part of his land his land has a high water holding with a low PH of 2.0. He planted maize and some plants emerged with purple leaves which left him wondering. Available information shows that maize grows well on a PH of 5.8 – 7.0.

Task

Advise Peter on what should be done on his land so that he can improve on maize production.

Turn over

SECTION B

Part I:

(ANIMAL PRODUCTION)

Answer only one item from this part.

Item 3

Poultry keeping is becoming popular in Uganda most of the farmers have started it so that they earn a living. Mr. Kataara asked his father a piece of land and constructed a poultry house with no ventilators to safe guard his birds from thieves. He decided to roof his poultry house with iron sheet that had some holes for air circulation.

During rainy days the house floor becomes dump. His birds lay eggs on the floor which has little litter (coffee husks) leading to brokage of some eggs. Some eggs had soft sell that attracted egg eating by some birds. He usually collects eggs once a week and keeps them in a basin.

Drinkers and feeders were dirty and observed some birds having wounds on their bodies and some having dropping wings. He decided to sell off young stock of one month old birds.

Task

Guide Mr. Kataara on how to manage poultry better for increased production.

Item 4

Buyunga village farmers association went for a tour in western Uganda. They visited one of the dairy farmers who had 500 heads of cattle and he was doing well in the project.

The farmers admired and solicited money for beef cattle production. They bought ten (10) young Zebu cattle. And started grazing them in a swampy unfenced area containing a lot of snails. On the same farm, some buildings were observed with wet walls and others sinking to the ground.

Castrated some bulls using a sharp panga to render from mating. Some animals were coughing and passing out watery stool. Feeding was based only on cereal pastures, this lowered down the growth. This prompted the farmers to sell off some animals when they are one year for meat production, they were slaughtered on fresh banana leaves under a tree. Traditionally Zebu cattle reach slaughtering at 3-4 years if grazed on pasture only.

Turn over

Task

Advise the farmers on how to improve on the beef production in order to satisfy their customers.

PART II

CROP PRODUCTION

Respond to only **one** item from this part

Item 5

Sorghum is among the cereal crop grown in Uganda by some communities. Kato came up with the idea of growing it, cleared the bush using a hand hoe and selected for a tall variety that he bought from a friend.

Planted 5(five) seeds per hole, all germinated and left them to grow up to harvesting time, in the spacing of 40cm between the rows and 20cm between plants. One week after planting, other plants that are not crops were seen in the garden. Some sorghum stalks had holes and yellow leaves. He harvested after 2.5 months using a panga. Available research shows that tall sorghum variety reach maturity at 100-120 days and spacing of 90cm to 30cm.

Task

What advise can you give to Kato so that he can obtain maximum profit from his project.

Item 6

Vegetables are edible crops rich in vitamins and minerals. Usually eaten in small quantities as accompaniments to the main dish. A group of farmers started a tomato growing project. Established a nursery bed where they broadcasted the seeds in the bed and covered with dry grass, watering using a basin. After four weeks, the seedlings were transplanted to the main garden during mid-day when it was too hot.

This resulted to many gaps in the garden. One week after transplanting weeds started germinating. Some of the tomato branches with fruits were seen lying on the ground and appearing dry. Some tomato fruits had holes. Harvesting was done after seeing over ripening of the tomatoes and some were rotten.

Turn over

Task

Advise the farmers on how to overcome the challenges above.
